Comprehension for (Q.No.96 to Q.No.98)

Loss of water from aerial part of the plant body in the form of water vapours called transpiration. Leaves are the main site for this process. It mostly occurs during day period and negligible during night. It is similar to the sweating in animals. Rate of transpiration causes a suction pressure in xylem vessels of the plant. it's value depends on surrounding environmental conditions. Excess transpiration causes wilting in plant. In some plants, to check the rate of transpiration certain motor cells are found on the leaf margin.

96. In transpiration

(1) Pure water is lost (2) Water in the form of dilute solution is lost

(3) Only minerals are lost (4) Only water soluble organic materials are lost.

97. Wilting in plant takes place due to:

(1) Less transpiration (2) More transpiration (3) No transpiration (4) None of the above

98. In plants transpiration helps in:

(1) Maintaining shape of plant cells (2) Controlling temperature of plant body

(3) Absorption of water and minerals from the soil (4) All of the above

Comprehension for (Q.No.99 & Q.No.100)

Oxidation of various organic food materials to release energy for various metabolic activities in living organisms is called aerobic respiration. Glucose is the main organic compound oxidised first during this process. In first step, without use of oxygen, glucose breaks up into 2 molecules of pyruvic acid in cytoplasm called glycolysis. In presence of oxygen pyruvic acid enters into mitochondria and completely oxidise into carbon dioxide and water to release maximum energy, the process involved are Kreb's cycle and Electron Transport System (ETS).

99. Which step of cellular respiration does not require oxygen:

(1) Glycolysis (2) Kreb's cycle (3) ETS (4) All of the above

100. In aerobic respiration, maximum energy is released because:

(1) There is incomplete oxidation of glucose molecule

(2) There is complete oxidation of glucose molecule

(3) There is partial oxidation of glucose molecule

(4) None of the above
