SOLUTIONS

1. The amount of dead organic matter accumulated on the forest floor at any given point of time diflers as one goes from equator to higher altitude. The table given below represents 4 forest types with the amount of dead organic matter measured per hectare.

Forest type	Mass of dead organic matter (tons/ha)
M	10
N	2
O	85
P	30–45

Which one represents a tropical rain forest?

(a) M (b) N (c) O (d) P

Ans. (b)

2. IUCN has listed several criteria in order to protect the area under the biological diversity hotspots. Some of these criteria are 1) the area must support 0.5 percent of the global total plant species (≈3,00,000) and 2) the region must have lost more than 70 percent of of its original habitat Based on this IUCN has already protected 25 hot spots all over the world.

A researcher comes up with four areas (i, ii, iii and iv) that support several endemic plants and face substantial loss of their natural habitat over a period. Which of these area/s can be protected under the global biodiversity hotspots?

Name of area	Number of endemic plant species in the area	Total area of Habitat (in sq km)	Loss of habitat (sq. km)
i	1250	15000	7500
ii	1512	80000	64000
iii	1525	90000	62000
iv	1275	36000	6000

(a) i and ii only (b) iii and iv only (c) ii only (d) iii only

Ans. (c)

3. 'Reproductive isolating mechanisms play an important role in speciation. One such interesting example is of two closely related species of cicadas of the genus Magicicada. Both Magicicada tredecim and Magicicada septendecim spend almost 99% of their lifetime underground in immature nymph state. They feed on xylcm fluids from the roots. Individuals of both the populations are developmentally synchronized and in both the species, emergence occurs in large numbers. The mature nymph of Magicicada tredecim emerges out after 13 years and moults into adult form whereas Magicicada septendecim emerges out after 17 years. Therefore, even though being closely related and belonging to the same habitat, interspecific mating is avoided. This type of reproductive isolation is

(a) Spatial isolation (b) Temporal isolation
(c) Mechanical isolation (d) Behavioural isolation

Ans. (b)

4. Under normal circumstances, lipid bilary of cell membrane allows certain molecules to readily pass through it. Which one is the correct order of molecules with respect t increasing permeability across the membrane.

(a) Vit A < Ca^{2+} < Glycerol < Glucose (b) Ca^{2+} < Glucose < Glycerol < Vit. A

(c) Glucose < Glycerol < Vit. A < Ca^{2+} (d) Glycerol < Vit. A < Ca^{2+} < Glucose

Ans. (b)

5. An experiment was carried out with a purified extract of a functional protein ribonuclease (R). The following steps were followed.

(i) Extract and purify R from tissue

(ii) Add urea (disrupts the H_2 and ionic bonds) and mercaptoethanol (discrupts disulphide bridges.)

(iii) Slowly remove the chemical agents used in the previous steps and then check for enzyme activity.

(iv) Functional protein detected.

The type of structures/s of R affected at step (ii) is/are

(a) 1° and 2° structures (b) 2° and 3° structures

(c) 3° structure only (d) 1° structure only

Ans. (b)

6. A few statements regarding C_3 C_4 and CAM plants are given. Mark the correct statement.

(a) In C_4 plants, the C_4 and C_3 pathways are separated temporally.

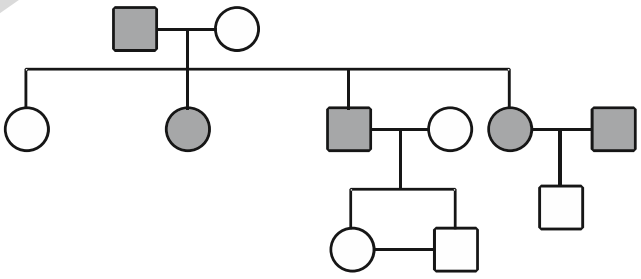
(b) CAM plants utilize the C_4 pathway during the day and the C_3 pathway at night.

(c) The C_3 pathway takes place in the bundle sheath cells of the C_4 plants

(d) Both C_4 and CAM plants keep their stomata open at night.

Ans. (c)

7. A pedigree for a rare congenital cataract condition is given below



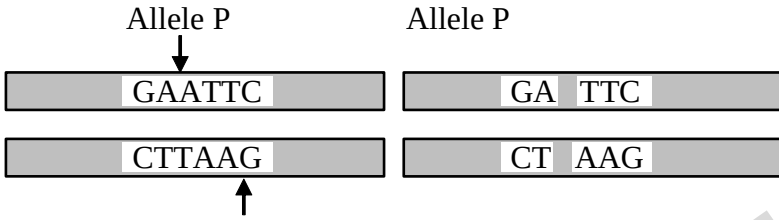
the most likely mode of transmission of the trait is:

(a) X-linked dominant (b) X-linked recessive

(c) Autosomal dominant (d) Autosomal recessive

Ans. (c)

8. Restriction fragment length polymorphism (RFLPs) are differences in DNA sequence due to mutations in restriction sites. These can serve as genetic markers. The RFLP gel patterns for members of family can be obtained by restriction digestion of the sample containing the alleles for a particular trait and then carrying out electrophoresis, probing and blotting.
Consider the following alleles - P (dominant allele) and p (recessive allele) responsible for an autosomal recessive trait. Note: Arrow indicate restriction sites.



The number of bank the the RFLP profiles of an unaffected, affected and carrier individual for this trait would respectively show is:
(a) 2, 1 and 2 (b) 1, 1 and 3 (c) 1, 2 and 3 (d) 1, 1 and 2

Ans. (b)

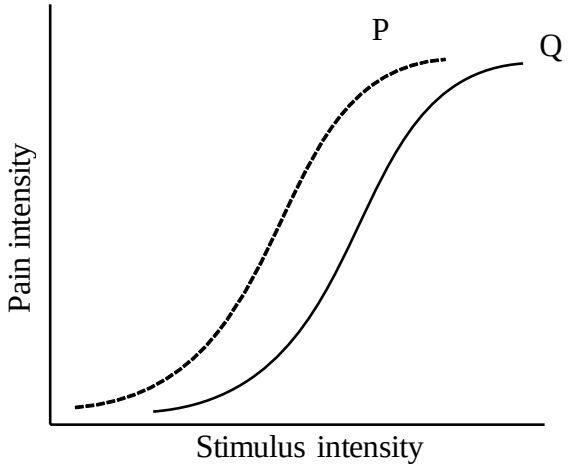
9. The presence or absence of certain structures in three types of cells is tabulated below.

	Plant	Animal	Bacteria
M	Present	Present	Present
N	Present	Present	Absent
O	Present	Absent	Present

Structures M, N and O could respectively be:
(a) Nucleus, Golgi apparatus and cell membrane
(b) Cell wall, endoplasmic reticulum and chloroplast
(c) Centriolcs, ribosomcs and cell wall
(d) Ribosomes, endoplasmic reticulum and cell wall

Ans. (d)

10. The sensation of pain and its intensity begins with the peripheral receptors (nociceptors) that are: activated by thermal, mechanical, and chemical stimuli. Nociceptors are found in the skin, muscle and viscera. Hyperalgesia refers to an abnormally increased sensitivity to pain, which may caused by damage to nociceptors or peripheral nerves and can cause hypersensitivity to stimulus. The following graph represents pain intensity as measured against stimulus intensity in two individuals represented by curves P and Q.



Mark the correct statement from the following statements.

(a) Curve P shows early habituation to pain as compared to Q.

(b) Curve Q could be the response in a normal healthy person while curve P could be a victim of platypus venom which is known to cause increased sensitivity to pain.

(c) Curve Q shows increased sensitization to stimulus of the same intensity as compared to that m curve P.

(d) It has been observed that long-term opioid usage for treatment of chronic pain leads to hyperalgesia. This can be observed in curve Q.

Ans. (c)

11. The type of parental care for a particular species of fish, bird and mammal is given below;

Species of	Parental care	Mating Type
Fish	Male only	X
Bird	Both male and female	Y
Mammal	Female only	

Mating systems X, Y and Z respectively, in these species would most likely be:

(a) Polygyny; promiscuous and polyandry (b) Monogamy; Polygyny and monogamy

(c) Polyandry; monogamy and polygyny (d) Polyandry; monogamy and polyandry

Ans. (c)

12. Pulse-chase analysis is a commonly used technique to study proteins in the cell. Cultured cells expressing the protein of interest arc allowed to take up radioactively labelled amino acids for a brief interval (pulse) during which all the newly synthesized proteins incorporate the label. In an experiment 3H-lcucinc was added to n cell culture to label secretory proteins in the cell and radioactivity al different locations in the cell was recorded at 5. 10 and 45 minutes after addition. Which organelles respectively will show maximum radioactivity al these time points respectively?

(a) Golgi apparatus; endoplasmic reticulum and secretory granules

(b) Secretory granules; endoplasmic reticulum and Golgi apparatus

(c) Endoplasmic reticulum; secretory granules and Golgi apparatus

(d) Endoplasmic reticulum; Golgi apparatus and secretory granules

Ans. (d)

13. Treatment with which type of the following enzymes will be the most effective in digesting the basic framework of the myelin sheath around the axons?

(a) Glycosidase (b) Protease (c) Nuclease (d) Lipase

Ans. (d)

14. Modem vascular plants have evolved organs like the roots, stems and leaves to support terrestrial life. In evolutionary history, structural modifications are products of natural selection, that enable specialized adaptations' Pair the following plants with the plant organs that support an adaptation:

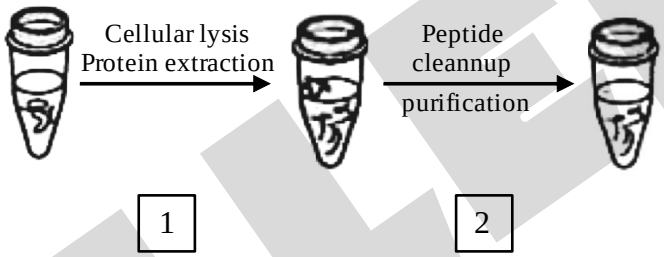
I	Solanum tuberosum
II	Beta vulgaris
III.	Allium cepa

i.	Root
ii.	Shhot

(a) I - ii, II- i, III - ii
(b) I - i, II- ii, III - ii
(c) I - ii, II- ii, III - i
(d) I - i, II- i, III - ii

Ans. (a)

15. The following image shows a sequences of processes involved in the classical solid-liquid extraction of peptides from a cell culture.



Which of the following enzymes is generally used in this process during the step marked 1?
(a) Lipase (b) Trypsin (c) Pepsin (d) Papain

Ans. (a)

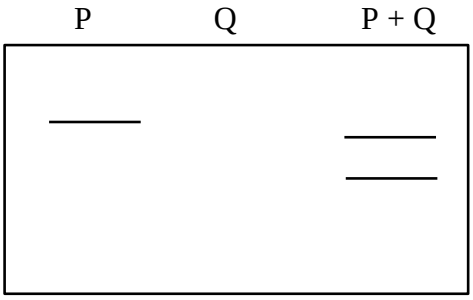
16. Which among the following statements about chloroplast is false?
(a) Protein found in chloroplast are either encoded by the chloroplast DNA or the nuclear DNA.
(b) Chloroplast genes exhibit Mendclian pattern of inheritance.
(c) Phoiosystems I and II are spatially separated in the thylakoid membrane of the chloroplast
(d) Chemiosmotic mechanism converts the energy stored in chemical and electric potential to Air similar to mitochondria.

Ans. (b)

17. Which of the following is true for a competitive inhibitor of an enzyme?
(a) The inhibitor increase the stability of enzyme-substrate complex formed.
(b) Maximum reaction velocity cannot be reached even at very high concentration of substrate
(c) Very high concentration of substrate can relieve inhibition completely.
(d) The inhibitor only binds to the enzyme-substrate complex.

Ans. (c)

18. P and Q are the two nuclear proteins that are required for activating transcription of gene Y. Individually neither of the two is sufficient to activate the transcription of the gene Y. The upstream DNA sequence of gene Y was used to study the DNA binding properties of purified P and Q proteins separately as well as in combination. The bound fractions were cluted and confirmed by Western blotting (shown below) using antibodies against P and Q.



From the above which of the following statements are true

(i) Only P can bind to upstream DNA of gene Y

(ii) P and Q both can bind to upstream DNA of gene Y

(iii) Q activates transcription once it is recruited to upstream DNA of gene Y and P

(iv) P is likely to activate the transcription of gene Y

(a) (i) and (iv) (b) (ii) and (iv) (c) (i) and (iii) (d) (ii) and (iii)

Ans. (c)

19. Following table depicts the carbon transport and decarboxylation in C_4 plant species. Fill in the blanks with the correct options for P, Q and R.

C_4 acid transported to bundle sheath cells	C_3 acid transported to mesophyll cells	Decarbxylase
Malate	—P—	NADP + malic enzyme
—Q—	Alanine	NAD + malic enzyme
Aspartate	—R—	PEP carboxykinase

(a) P : Pyruvate Q: Aspartate R; Pyruvate

(b) P : Pyruvate Q : Malate R: Alanine

(c) P : Aspartate Q : Pyruvate R: Malate

(d) P : Aspartate Q : Aspartate R : Phosphoenol pyruvate

Ans. (a)

20. When two species of Monkey Flower plant (X and Y) were studied, following data was obtained:

Species	Nectar volume (µ1)	Seeds per flower	Weights of horizontal shoots (stolons) that develop into roots
X : Minulus eastwoodiae	4.94	25	0.49
Y : Mimulus cardinalis	50	280	0.007

Which of the following statements about plant X and / or Y is correct?

(a) Plant X allocates more resources towards shoot growth as compared to plant Y.

(b) Plant X allocates its resources to asexual reproduction more than plant Y.

(c) Species X is likely to be native in habitat with abundant water availability.

(d) Roots to shoot growth ratio of bot plant show inverse relationship.

Ans. (b)

21. Few characteristics of a particular animal behaviour are listed below:

• Performed without learning

• Are stereotypic

• Cannot be modified by learning

Which type of behavior from the following do these indicate?

(a) Operant conditioning (b) Habituation

(c) Classical conditioning (d) fixed action pattern

Ans. (d)

22. Read the following observations made in the experiments done to investigate whether DNA or protein is the genetic material:

(i) ^{35}S labeled T_2 phages were adsorbed onto bacterial host cells. Upon thorough mixing bacterial cells and phage ghosts were separated. The radioactivity was recorded only in phage-ghosts and not in bacterial host cells.

(ii) ^{32}P labeled T_2 phages were adsorbed onto bacterial host. Upon thorough mixing bacterial cells and phage ghosts were separated. The bacterial host cells exhibited radioactivity.

(iii) Purified DNA of ϕ174 bacteriophage can successfully infect bacterial protoplasts and produce parental phage progeny.

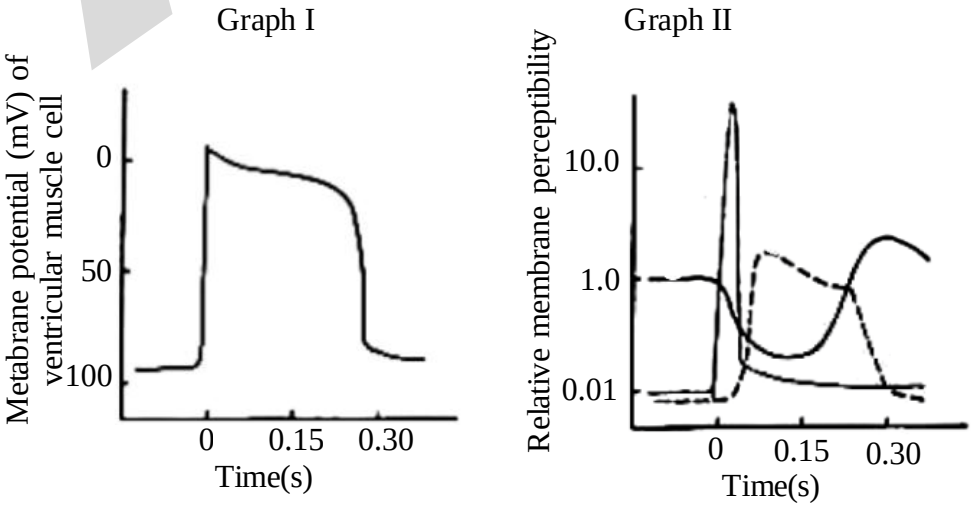
Which of the observations confirm that DNA and not protein propagates genetic information?

(a) Only (i) (b) Only (i) and (ii)

(c) Only (ii) and (iii) (d) (i), (ii) and (iii)

Ans. (d)

23. The change in membrane potential of ventricular muscle cell are depicted in graph I. These changes result from the activity of the various ion channels involved in nverve conduction as represented in a corresponding graph II.



P, Q and R in graph II respectively correspond to:
(a) K^+ channels; Na^+ channels and Ca^{2+} channels
(b) K^+ channels; Ca^+ channels and Na^{2+} channels
(c) Na^+ channels; K^+ channels and Ca^{2+} channels
(d) NA^+ channels; Ca^+ channels and K^+ channels

Ans. (d)

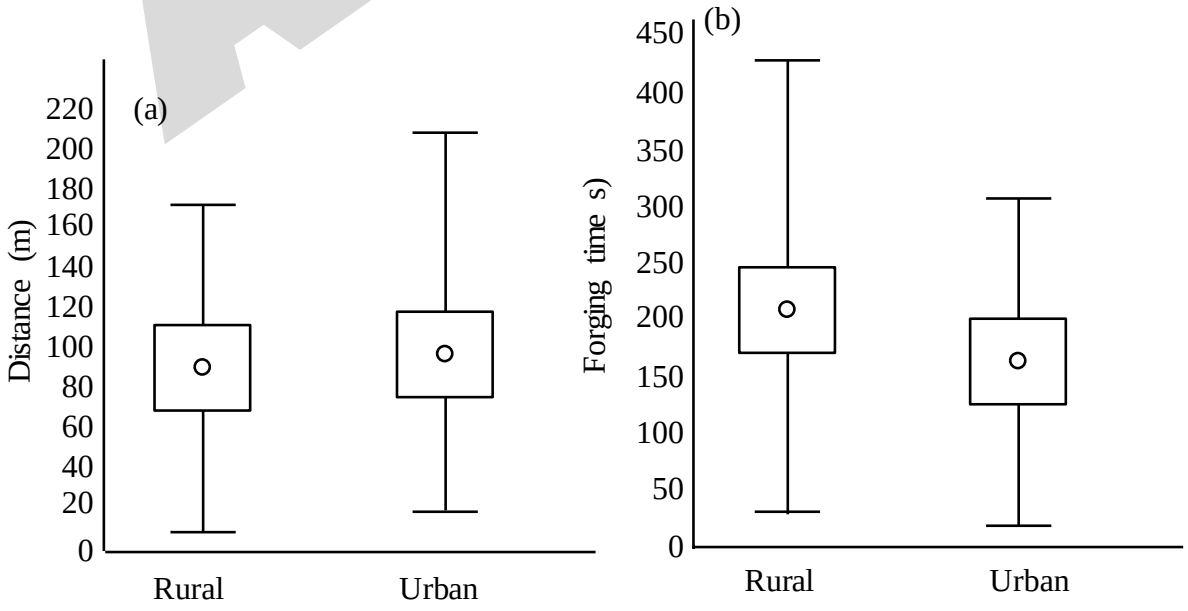
24. An enzyme "M" has a low Km value relative to the physiological concentration of its substrate. Another enzyme "N" has a high Km value relative to the physiological concentration of tis substrate. In the normal physiological condition and substrate concentrations within the physiological range, which of the following statement is correct?
(a) The activity of "M" will vary as the concentration of substrate varies and the rate of formation of product will depend on the availability of substrate.
(b) Enzyme "M" will act at more or less constant rate, regardless of variations in the concentration of substrate.
(c) Enzyme "M" will not be normally saturated with the substrate.
(d) Enzyme "N" will act at a more or less constant rate, regardless of variations in the concentration of substrate.

Ans. (b)

25. A realized niche is the space occupied by a species under real-world conditions. Identify the factors that influence the establishment of realized niche of a species.
(i) interspecific competition
(ii) predation
(iii) availability of resources
(iv) intraspecific competition
Choose the correct option
(a) (i) and (iii) only
(b) (ii), (iii), and (iv) only
(c) (i), (iii) and (iv) only
(d) (i), (ii), and (iii) only

Ans. (d)

26. A study conducted to analyses the foraging strategies of house sparrow compared observation on sparrow population in rural and urban surroundings. The image below depicts the findings.



The Marginal Value Theorem says that animals must forage by using most economic and efficient strategy that will balance energy gain and consumption. Which of the following interpretations of the study results, support the theorem?

(a) The foraging distances in urban environs are shorter while those of rural environs are longer.
(b) The sparrows spent more time in foraging in urban environs due to more "artificial habitats" in urban environs.
(c) The sparrows spent less time foraging in urban areas where resources are at larger distances
(d) Rural environs with "more natural" habitats offer lesser resources at shorter distances.

Ans. (c)

27. Which of the following cannot be considered an advantage of the efficient photosynthetic pathway for the fixation of atmospheric carbon dioxide in C_4 plants?

(a) It facilitates adaptation to arid conditions.
(b) It jacilitates adaptation to high temperatures.
(c) It facilitates lower energy cost per CO_2 fixed.
(d) It facilitates survival in marginal environments.

Ans. (c)

28. Like the bony skeletons in vertebrates, haemolymph hydraulics enables some invertebrates in locomotion. Which of the following animals uses haemolymph hydraulics for locomotion?

(a) Grasshopper (b) Spider (c) Crab (d) Octopus

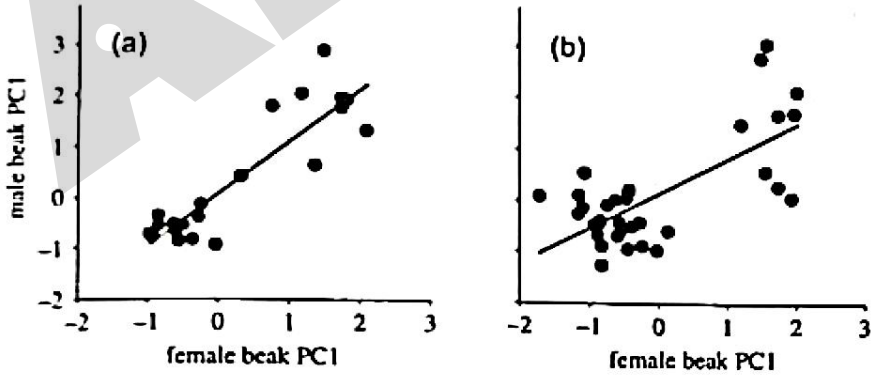
Ans. (b)

29. Which of the following has a turnover time equal to lifetime of humans?

(a) Lens of the eye (b) Sperm cells
(c) Muscle cells of ribs (d) Hepatocytes

Ans. (a)

30. The population of Medium Ground Finch (Geospiza fonis) on Santa Cruz Island of Galapagos, features mainly large and small beak size morphs, with relatively few intermediates. The Figures (a) and (b) below depict the pairing patterns in two different breeding seasons. Male and female 'beak PCI' values are Principal Component - I. indices derived based on beak length, depth and width.



Which of the following interpretation is correct?

(a) This type of breeding indicates a reproductive isolation purely of allopatric origin.
(b) There is disruptive selection in sympathy against birds with intermediate beak sizes.
(c) The pairing pattern indicates a selection pressure for intermediate beak sizes.
(d) The trend in the pairing patterns seen in two seasons indicates an efficient reproductive isolation between the morphs.

Ans. (b)

31. If one starts with 10,000 (10^4) bacterial cells in a culture that has a generation time of 2 hours, what would be the magnitude (ten-fold) of increase in cell number at 4 hours, 24 hours and 48 hours respectvely?

(a) Less than 1,4, and 7 (b) 1,3, and 7

(c) Less than 1,5, and 9 (d) 4, 16 and 49

Ans. (a)

32. If atmospheric PO_2 is 130 mm of Hg and alveolar PO_2 of a person is 85 mm of Hg, which of the following is most likely correct?

(a) The person is suffering from lung dysfunction.

(b) The person is respiring at high altitude.

(c) The partial pressure of oxygen in pulmonary arteries for the person must be between 60-130 mmHg.

(d) The partial pressure of oxygen in pulmonary veins for the person must be between 40-60 mmHg.

Ans. (b)

33. Consider the following pathway involving glycolysis that further leads to citric acid (TCA) cycle. (PFK = Phosphofructokinasc)

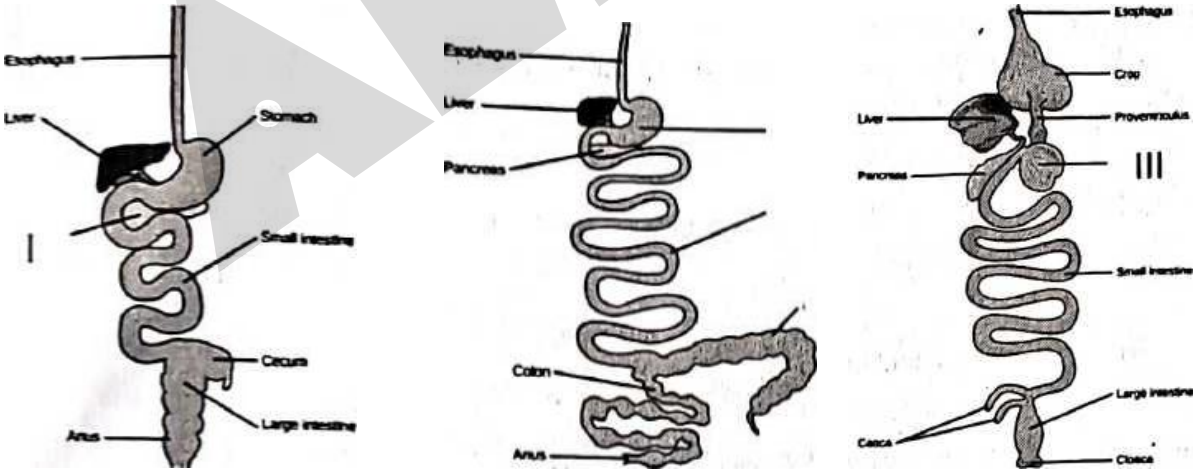
Glucose $\rightarrow$ F–6–PO_4 $\xrightarrow[PFK]{\Longrightarrow}$ Fl,6,bisPO_4 $\rightarrow\rightarrow\rightarrow$ Pyruvate $\rightarrow$ Acetyl CoA $\rightarrow$ TCS Cycle

Which of the following molecules arc likely to act as activators and inhibitors respectively of the enzyme PFK?

(a) Citrate and ATP (b) AMP and ADP (c) ATP and citrate (d) AMP and citrate

Ans. (d)

34. The Gastrointestinal tracts with some associated organs are shown in the diagrams below. The names of the organs marked I, II and III respectively are;



(a) Duodenum, gall bladder and cardiac stomach

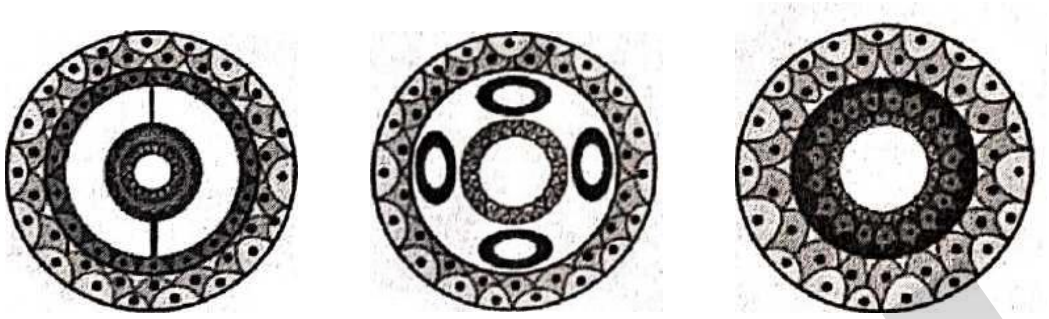
(b) Gall bladder, Intestinal diverticulum and pyloric stomach

(c) Pancreas, caecum and gizzard

(d) Pancreas, Intestinal diverticulum and stomach

Ans. (c)

35. Coelom is the fluid filled space between the body wall and the digestive system. Its absence or presence significantly influences classification of animals. The schematic diagrams (i), (ii), and (ill) below depict three different variations in the coelomic condition. Select the correct sequence of animal group to respectively match the coelomic types (i), (ii) and (iii).

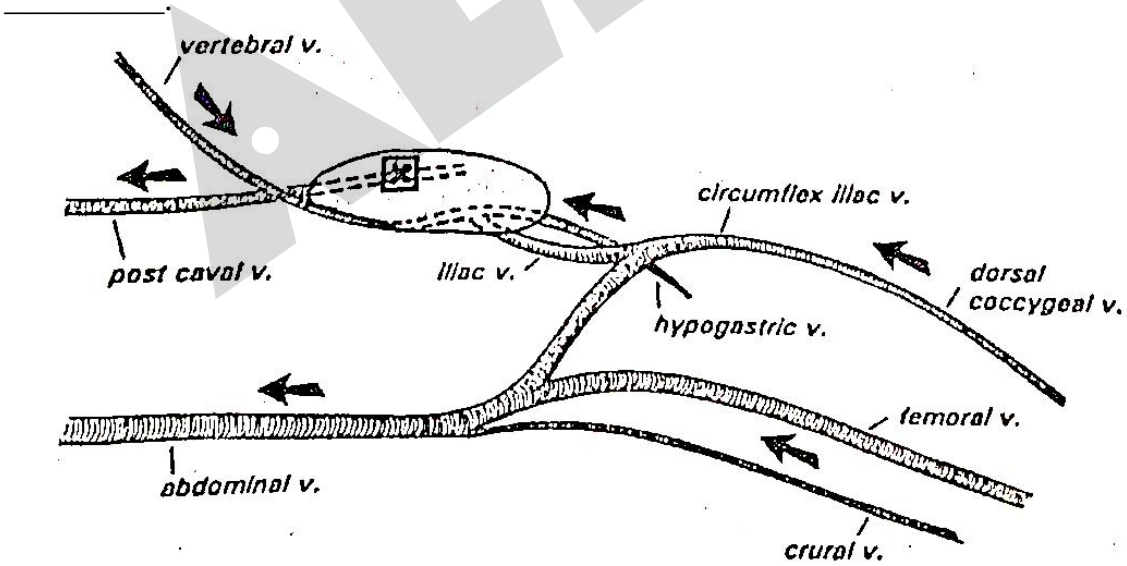


(i) (ii) (iii)

(a) Annelids, Roundworms and Flatworms
(c) Flatworms, Roundworms and Annelids
(b) Roundworms, Flatworms and Annelids
(d) Annelids, Flatworms and Roundworms

Ans. (a)

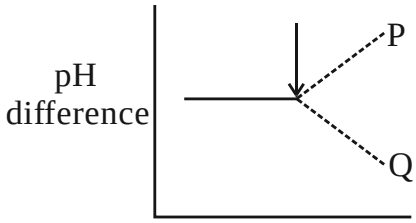
36. One of the portal systems evolved in lower vertebrates is to help drain the muscular hind legs. The image below depicts that portal system in the red-eared terrapin (Trachemys scripta elegans), a fresh water turtle and the most commonly kept pet reptile. The organ marked "☒" is



(a) Lymph node (b) Kidney (c) Testis (d) Liver

Ans. (b)

37. pH difference across inner mitochondrial mcnibrnnc over lime in an actively respiring can is ------ graph. The likely effects of addition of P and Q to the cell nl the time indicated by arrow are also shown. Which of the following statements is correct?



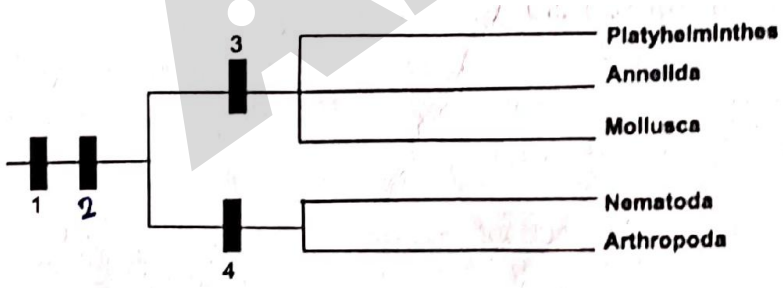
(a) P is likely to be ATP synthase inhibitor.
(b) Q is likely to be cytochrome inhibitor.
(c) P is likely to be metabolic activator.
(d) Q is likely to be activator of anaerobic respiration.

Ans. (a,b,c)

38. Siamese cats show a mutated enzyme tyrosinase (required for the synthesis of melanin) that is active only below a temperature of 33°C. Based on this information, which of the following is likely to be correct?
(a) Newly born Siamese kittens are likely to be creamy or white in colour.
(b) As the young grow to adulthood, mainly their belly portions are likely to turn dark.
(c) Newly born Siamese kittens are likely to show darker nose, paws, and ears than the rest of the body as compared to adults.
(d) The body of the Siamese cat is likely to be darker in summer as compared to winter season.

Ans. (a)

39. Phylogenetic classification of five animal phyla is shown below.



Which of the following options correctly identifies the characteristics associated with labels 1 to 4?
(a) 1 is Bilateral symmetry and 3 is Protostomy.
(b) 3 is Diploblasty and 4 is Triploblasty.
(c) 1 is Bilateral symmetry and 2 is Deuterostomy.
(d) 2 is Protostomy and 3 is Spiral cleavage.

Ans. (d)

40. Among several excretory products of animals, P, Q and R are tabulated along with their properties.

Properties	P	Q	R
A Toxicity	+++	++	+
Energy cost	+	++	+++
Water loss during excretion	+++	++	+

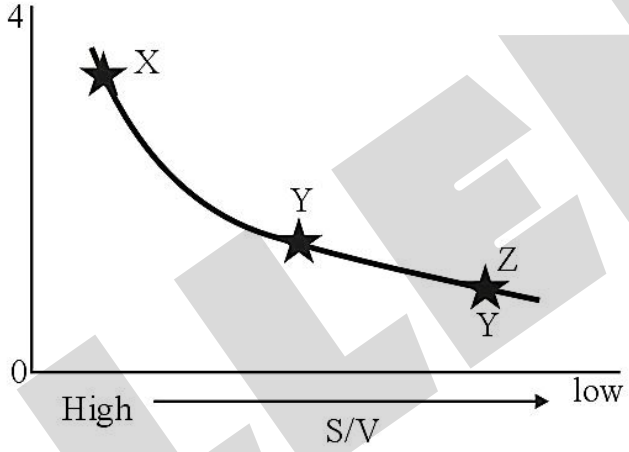
Waste product P most likely is:

(a) Urea (b) Carbon dioxide (c) Uric acid (d) Ammonia

Ans. (d)

41. Weight specific oxygen consumption and body surface area to volume (S/V) ratio of three animals (X, Y and Z) is depicted in the graph.

X, Y and Z respectively indicate:

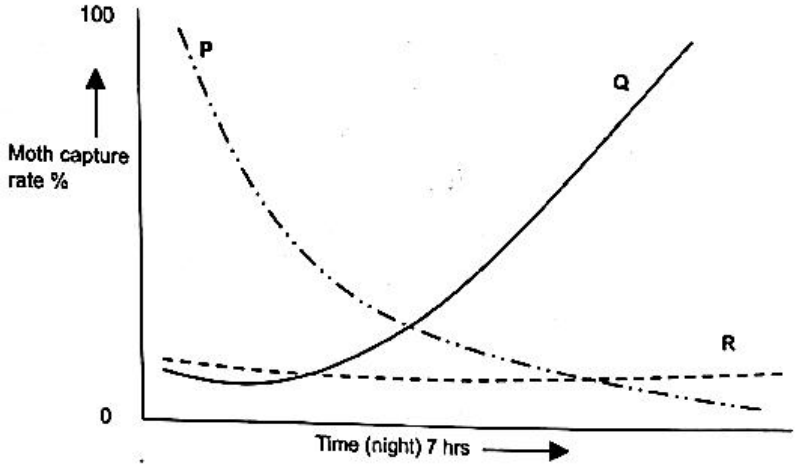


(a) Elephant, human, dog (b) Shrew, sheep, cat

(c) Mouse, sheep, elephant (d) Horse, dog, cat

Ans. (c)

42. In the event of a bat attack, tiger moths show three different types of responses. Some tiger moths show warning colouration indicating their toxic chemical defense while some moths produce clocking sounds to jam bat's sonar. Some moths show acoustic startling responses to deter the attacking bats. Scientists experimented with a bat colony that was not exposed to these moths. When they studied the month capture rate against each of these moth responses, the following data was obtained.



Which of the following can be deduced from these results?
(a) P indicates response to jamming behaviour.
(b) Q indicates response to acoustic startle behaviour.
(c) R indicates bat's response to warning colouration for chemical toxicity.
(d) R indicates control behavior of bats in absence of all the three types of moth behaviour.

Ans. (d)

43. Zebra finches are monogamous birds mainly found in Australia and Indonesia. These birds (both male and female) lack any crest feather (ornamentation) on their head. To study the mate choice behaviour of zebra finches, the following experimental groups of modified individuals were made.

Group	Modification	Mate preference of female offspring
I	Both male and female ornamented and mated.	Ornamented male
II	Only males ornamented and mated with females.	Ornamented male
III	Only females ornamented and mated with males.	Both preferred equally
IV	Neither sex was ornamented and mated.	Both preferred equally

The results indicate that:
(a) Ornamentation of crest on either parent influences mate choice.
(b) Mate choice behavior is genetically determined and cannot be changed.
(c) Mate choice is influenced by imprinting.
(d) Mate choice behavior is dictated by presence or absence of ornamentation of female parent

Ans. (a)

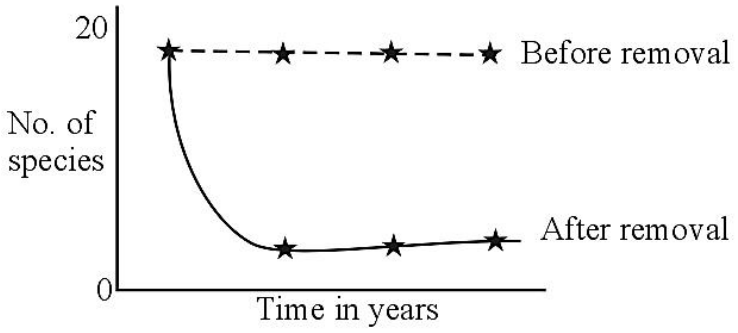
44. How many times does megaspore mother cell nucleus divide till the formation of female gametophyte in angiosperms?
(a) 5 (b) 11 (c) 4 (d) 8

Ans. (c)

45. Consider a germ cell having 3 pairs of homologous chromosomes. After meiotic division, how many possible, combinations of chromosomes will be found in egg cells.
(a) 8 (b) 16 (c) 6 (d) 9

Ans. (a)

46. On a rocky intertidal habitat, a sea star (Pisaster ochraceus) and mussel (Mytilus Californianus) are commonly found along with several other smaller size species of various animals and algae. When all sea stars were removed from the habitat, the results obtained are depicted in the following graph.



What can be deduced from this data plotted in the graph?

(a) Sea star was a likely predator of mussels that overgrew in the habitat in the absence of Sea star.

(b) Mussels are the keystone species of the habitat.

(c) ln absence of sea star, severe competition between the remaining-species led to their extinction,

(d) Sea star is the dominant competitor for space to all other species thriving in the intertidal zone.

Ans. (c)

47. Primary spermatocytes undergo meiotic division to give rise to sperm cells. Nondisjunction of sex chromosomes during this division can lead to male gamete formation with abnormal number of chromosomes. If such a sperm cell fuses with a normal egg cell, which one of the following genotypes will not be found in the offsprings?

(a) XXY (b) XXX (c) XYY (d) YO

Ans. (d)

48. Australian Bush fly lays its eggs in the fresh dung of herbivores As the dung hardens, no more eggs can be laid. When the eggs hatch, larvae feed on the dung until they pupate m the nearby soil. In an experiment, fixed volume of cow dung cakes (2 dm^3) was populated with different number of eggs ranging from 1400 – 4250. Figure 1 shows percentage of eggs emerged as adults from each dung cake. Each dot represents a 2 dm^3 dung cake. Figure 2 represents percentage survival for any original egg number which will give exactly 915 adults. What conclusion can be drawn?

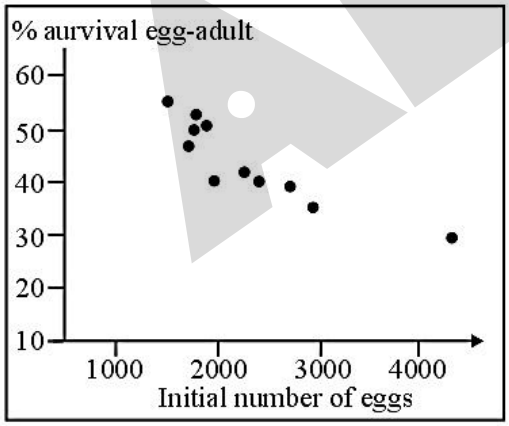


Figure 1

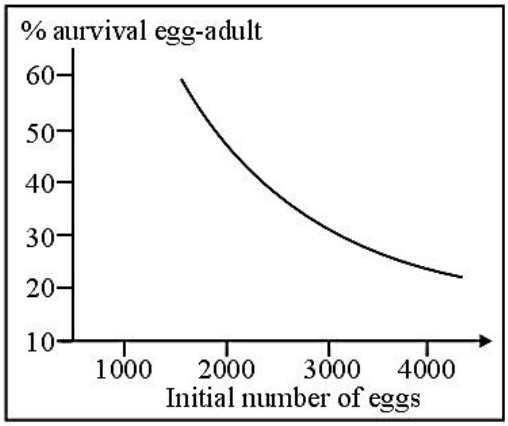

Figure 2

(a) The number of adults emerging from the dung cake of any size is always fixed.

(b) Dung cake populated with lesser number/f eggs would have given higher number of adults emergence.

(c) Number of adults emerging is fixed if dung cake size is nearly constant.

(d) All the eggs laid by bush fly are not viable if the number is above 1400.

Ans. (*)

49. Lettuce seeds are known to germinate if exposed to a brief period of light. Plant physiologists carried experiments to study the effects of repeated alternating flashes of red light (R) for 01 minute and far-red light (FR) for 4 minutes on the germination of lettuce seeds. The results of four experiments (1 – 4) are tabulated below.

Experiment	Treatment	Observations
1	R	Most germinate
2	R – FR	Few germinate
3	R – FR – R – FR – R – FR – R	Most germinate
4	R – FR – R – FR – R – FR – R – FR	Few germinate

Basedpn the results obtained, mark the correct statement(s) from the following:

(a) Red light and far-red light reverse each other's effects.

(b) Dormancy in experiment 4 could be overcome if the sequence had 4 periods of red light preceding the last far-red period.

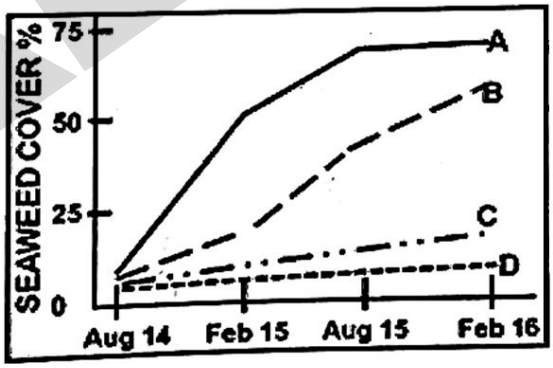
(c) The ratio of 1:4 minutes of R:FR is required to ensure germination.

(d) The final exposure determines the germination response.

Ans. (a,c,d)

50. An experiment was carried out to understand animal interactions and community structure in an intertidal habitat. Four experimental plots were created: (A) Both Sea urchin and Limpets are removed, (B) Only Sea urchins are removed, (C) Only Limpets are removed and

(D) None is removed (Control). The % seaweed cover recorded over the experimental period lasting several months is depicted below;



Which of the following observations are correct?

(a) Seaweed growth was equally regulated by grazing of linnets and sea urchin.

(b) Limpets had least impact on the seaweed growth.

(c) Sea urchins have higher grazing potential as compared to limpets.

(d) In this community, sea urchins are regulators of the seaweed growth.

Ans. (b,c,d)

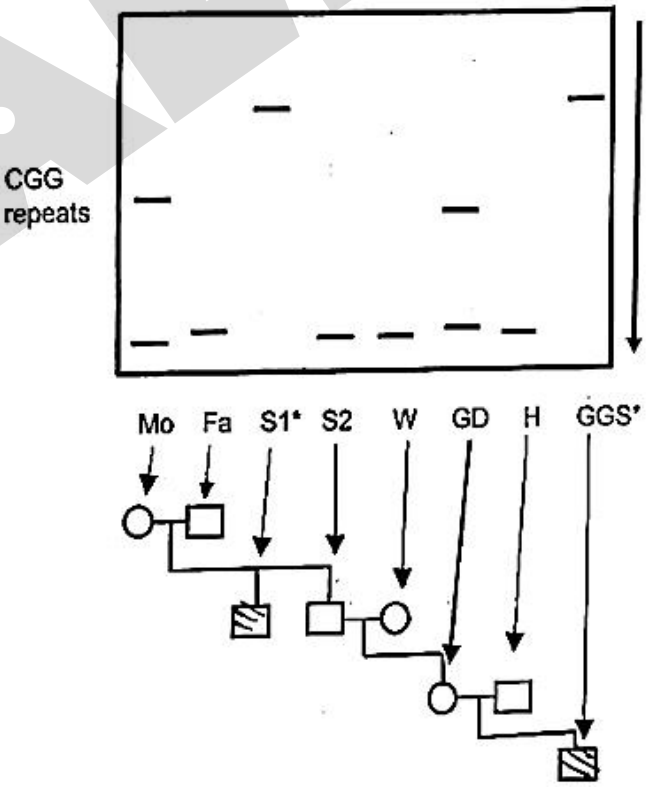
51. In Bioinformatics, transcriptome is identified as the complete set of mRNA transcripts produced by the genome at any oen time. Which of the following statements are correct?
(a) Transcriptomes are made up of the complementary regions of both intron and exon portions of the transcribed DNA
(b) Transcriptomes reflect the genes that are being actively expressed at any given times in the cell.
(c) Transcriptome shows the conserved regulatory sequences of genes in active physiological state of a secretory cell.
(d) Transcriptome varies considerably in different cells due to different patterns of gene expression.

Ans. (a,b,c,d)

52. Octopuses and Horseshoe crabs have blue blood because the protein transporting oxygen in their blood, hemocyanin, contains copper, instead of iron, making their blood appear blue rather than red. It is also seen in invertebrates living in habitats with very low temperature. Select the correct statement from the following.
(a) Hemocyanin binds more oxygen molecules than haemoglobin and is found freely floating in blood
(b) Hemocyanin binds less oxygen molecules than haemoglobin and is found in the haemocytes.
(c) Hemocyanin is more thermostable than haemoglobin and is bigger in size than haemoglobin
(d) Hemocyanin is less thermostable than haemoglobin and is smaller in size than haemoglobin

Ans. (a,c)

53. Fragile X Syndrome (FXS) is a X-linked genetic disorder in which CGG base triplet number is abnormal as compared to normal healthy individual. The carriers have intermediate copy number of CGG repeats. The presence of CGG region is responsible for inactivation of protein required in brain and neural development.
Gel pattern of CGG repeats along with the family pedigree is shown below. * indicates persons affected with FXS.



Which of the following statements are correct?

(a) CGG repeat number is found highest in diseased person.

(b) CGG repeat number remains stable when passed through sperm.

(c) The FXS trait is X-linked recessive.

(d) Individual S2 is a carrier for the disease and will transmit the disease to next generation.

Ans. (a,c)

54. Study the following reaction :

$$CO_2 + H_2O \rightarrow H_2CO_3 \rightarrow H^+ + HCO_3^-$$

$$\downarrow CO_3^{--}$$

$$HCO_3^-$$

The reaction indicates :

(a) Alveolar hyperventilation

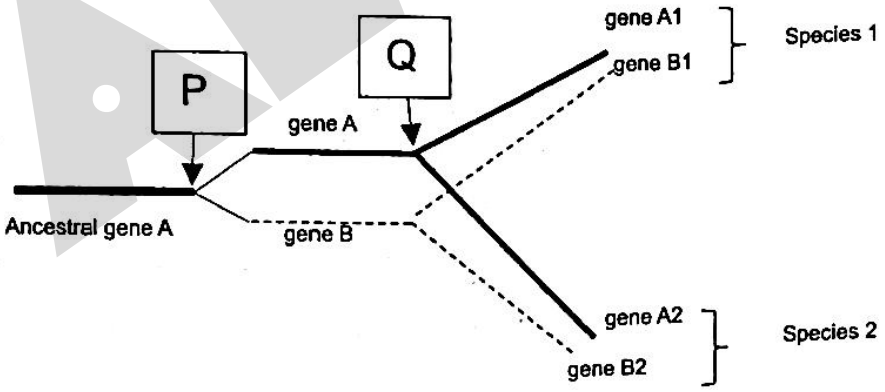
(b) Oceanic acidification

(c) Calcium depletion of coral reefs.

(d) Increased photosynthesis of oceanic algae.

Ans. (b,c,d)

55. An organism's evolutionary history is documented in its genome. Evolution of ancestral gene A is shown in the figure below. Genes Al and A2 are called orthologues while genes Al and Bl are called paralogues.



Which of the following statements are true?

(1) P and Q respectively indicate speciation and duplication events.

(2) Hemoglobin and myoglobin are examples of paralogous genes.

(3) Paralogous genes are likely to provide chance to evolve novel functions in an organism.

(4) Polypoidy observed in plants is an example of event P.

Ans. (*)

56. A scientist found a brown cat with ears having an unusual curl. In order to find if this trait is dominant or recessive, she mated the cat with a random cat of the same species with uncurled ears. The mating resulted in all offsprings with non-curled ears. Which of the following can be deduced from this?

(a) The assumption for curled ear trait to be dominant is justified by the results.

(b) The assumption that the curled ear trait is recessive would have got justified only ,f the offspring showed 1:1 ratio of both phenotypes.

(c) The assumption for curled ear trait to be recessive is justified by the results.

(d) The results confirm that the randomly chosen cat is true breeding.

Ans. (c,d)

57. Considering Meiosis II as an independent event, which one of the following phenomena makes Meiosis II different from Mitotic division?

i. Sister chromatids are held together by protein complex called cohesins m metaphase II only.

ii. Daughter cells may have sister chromatids with different genetic composition.

iii. In meiosis II, chromosome number of daughter cells remains unchanged

iv. DNA replication does not take place before prophase II.

(a) Only ii (b) Only i (c) ii and iv (d) i and iii

Ans. (c)

58. A few processes that occur in a cell are listed below.

(i) Cholesterol uptake

(ii) Chemiosmotic generation of ATP

(iii) Movement of oxygen into cells

(iv) Movement of glucose into cells

(v) Secretion of mucous

Which of the following statements regarding these processes are true?

(a) (i) and (ii) are active processes while (iii), (iv) and (v) are passive processes.

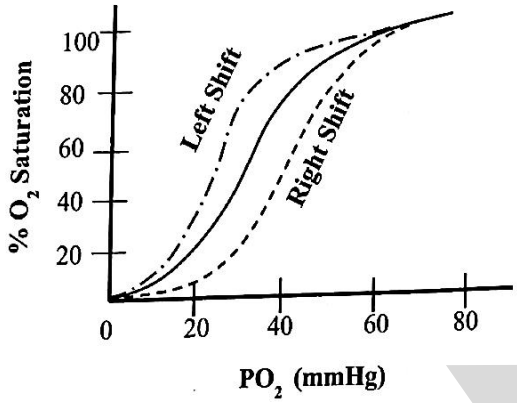
(b) (i) occurs by carrier-mediated endocytosis while (v) occurs by exocytosis.

(c) (iii) and (v) occur by direct passage through the membrane.

(d) A membrane protein is involved in the processes (ii) and (iv).

Ans. (b,c,d)

59. Approximatey 97% of the total oxygen is transported as haemoglobin-bond O_2. Our body tries maintain PO_2 in the blood and therefore oxygen delivery to tissues differs based on different physiological situations. The picture shows a O_2-dissoeiation curve (solid line). The curve shifts to right or left at different physiological conditions.



Based on the graph, indicate which of the following statements are true.

(a) At high altitude O_2 dissociation curve will exhibit a left shift.

(b) In Methemoglobinemia, where methaemoglobin (Fe^{3+} in heme) is higher man normal, a right shift of the normal curve is observed.

(c) During exercise, elevated level of CO_2 in the muscles needs to be removed. In this ease, the normal graph will shift to the right.

(d) In foetus, higher O_2 affinity of haemoglobin will cause a left shift of the curve.

Ans. (b,c,d)

60. Cortisol is a glucocorticoid hormone secreted in the blood whenever there is any kind of stress or 'fight or flight' situation. Which of the following is/are correct about this hormone?

(a) It is likely to follow circadian rhythm.

(b) It is likely to stimulate body carbohydrate and fat metabolism.

(c) It is likely to reduce the blood pressure.

(d) It is likely to induce immune system to mount greater response.

Ans. (a,b)
